Trudy, vyp. 28 (Transactions of the Moscow Institute of Geodetic, Aerial Survey and Cartographic Engineers, Nr 28) Moscow, Geodezizdat, 1957. 110 p. 1,400 copies printed.

Ed.: A. I. Mazmishvili; Ed. of Publishing House: T. A. Shamarova; Tech. Ed.: V. V. Romanova.

PURPOSE: This collection of articles is intended for geodesists, photogrammetrists, and cartographers.

This issue contains articles on geodetic surveying, photogrammetry, and cartography. The articles devoted to geodetic surveying discuss errors in precise leveling, an engineer level, COVERAGE: and the speed of light in a vacuum. In the field of photogrammetry there are articles on camera tilt, the use of photos of two scales in densifying control, and the differential method of aerial triangulation. Two articles in cartography discuss

velocity was measured by a M-48(M-48) instrument with a three-bowl receiver. The rotation of the bowls was mechanically transmitted to a d.c. tachometric generator, whose voltage was registered on a magnetoelectric oscillograph. The oscillograph simultaneously recorded the voltages removed from the wire potentiometer, these being proportional to the wind direction. The potentiometer data-unit was mounted on a wind measuring device with an M-48a screw receiver. Both parameters were recorded at intervals of up to 10 minutes, during which all the regularities of the random processes under investigation were fully displayed. The recordings obtained for the wind's velocity and direction were deciphered at an interval of 1 second. As a result of this tables were compiled for the change in the characteristic magnitudes, taken as the basis of the calculation from the derived formulas. It follows from the calculations cited for the wind velocity's spectral function that the components of the wind velocity's structure, amounting to 93% of the total dispersion, are included in the frequency interval from 0 to 0.3 sec-1; the components of the remaining 7% of the dispersion fall on the interval from 0.3 to ∞ sec-1. Thus, for practical purposes the re-

Card 2/3

Probable characteristics of ...

S/169/62/000/007/102/149 D228/D307

quired range of the measured wind velocity frequencies is from 0 to 0.4 sec-1. Analogous calculations of the spectral density function allowed it to be established that 75% of the dispersion is in the frequency range from 0 to 0.3 sec-1, 85% is in the range from 0 to 0.6 sec-1, and 90% is in the range from 0 to 1 sec-1. The remaining 10% of the dispersion lies in the range from 1 to ∞ sec-1. The wind's statistical characteristics allow the instrumental time constant, guaranteeing the necessary measurement precision, to be ascertained. In particular, it is necessary when measuring the direction to have a transmission band of~1 sec-1 for a 90% guaranteed determination of the dispersion. Having thus defined the instrument's range, it is possible to solve the problem of the characteristics of the random variations in the wind's parameters relative to their mean values. Abstracter's note: Complete translation. 7

TEXT: The author gives the method and the results of experimental investigations into the dynamics of operation of an electrolytic pick-up for the correction of the gyro vertical. The analysis was carried out for its linear part of operation by determining the static characteristic of the dependence of correction current on the angle of the pick-up. All measurements were made at ambient temperature +19°C. Numerical values of the pick-up time constant temperature from the oscillograms of transients and it was were obtained from the oscillograms of transients and it was found that this time constant had the same order of magnitude as found that of the vertical of the gyro itself and hence affects substantially the specific velocity of the latter. There are 3 figures.

Priborostroyeniye, v. 9, no. 1, 1966, 137-140 TOPIC TAGS: aerodynamic moment, aerodynamic R and D, meteorology ABSTRACT: A new gyroscopic device intended for measuring integral direction of an aerodynamic-moment vector is described. An air flow acting upon wind vane 1 produces torque Ma (see figure) which causes precession of the internal gimbal. Precession-angle sensor PAS, produces a signal proportional to the angle of rotation of the internal gimbal. The signal is applied to torque sensor TS, which causes precession of the external gimbal. The latter precession is always so directed that vane l is set along the vector of air velocity V. Torque sensor TS, is intended to

aligned in the direction of the flow, so that the aerodynamic moment produced by the vane is zero. At this moment, the inner frame is rotated by a certain angle. In order to prevent oscillations about the equilibrium position, the effector 7 produces a moment which is proportional to the angle of rotation of the inner frame and is opposite to the aerodynamic moment. The accuracy of the instrument is from 1 to equations, and it is shown that the angle a of rotation of the outer

 $\alpha = \frac{k}{Hc} \int M_a dt, \qquad (10)$

is actually proportional to the aerodynamic moment Ma on the vane. The coefficient before the integral is the integration constant which may change over a wide range-from a few minutes to several tens of minutes.

TITLE:

Majorization of Feynman Graphs

PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 4,

pp. 801 - 804

TEXT: The authors present the results of a further development of the idea of the majorization of Feynman graphs as suggested by Nambu and Symanzik (Refs. 1, 2). Every Feynman graph D represents a quadratic form $\mathbf{P}_{\mathbf{D}}$ of the external momenta $\mathbf{p}_{\mathbf{a}}$. On the condition that the law of conservation holds for the four-momenta k - in the inner lines of the graph k are linear functions of p_a and of the independent inner momenta t_i . If the following relation is valid for $K_D(x,p,t)$:

Card 1/4

Majorization of Feynman Graphs

S/020/60/135/004/009/037 B019/B077

$$K_{D}(x,p,t) = \sum_{V=1}^{L} d_{V}(k_{V}^{2} - m_{V}^{2}) = \sum_{i,j} a_{ij}t_{i}t_{j} - 2\sum_{i} b_{i}t_{i} + c$$
 (1)

where I is the number of inner lines of the graph, then the quadratic form can be determined from:

 $Q_{D}(c,p) = \begin{vmatrix} a_{i,j} & b_{i,j} \\ b_{i,j} & c \end{vmatrix}$ (2)

On the basis of known results, the following lemma and two more theorems are proved: lemma: the quadratic form Q_D is equal to the least value of the quadratic form K_D if the vectors \mathbf{k}_V fulfill the law of conservation of momentum in every unit of the graph, and if they assume a value from Card 2/4

Majorization of Feynman Graphs

S/020/60/135/004/009/037 B019/B077

the quantity P of all vectors of the type $p = \sum_{a} A_{a} P_{a}$ (A_{a} are real numbers). Theorem 1 reads as follows: Any graph can be majorized by any of its subgraphs. Theorem 2 reads as follows: If a graph D contains a polygon of (n+1) sides which has the mass M on n sides and the mass $M \subseteq M$ on one side, a new graph D' will be obtained if the change of mass is of the forms $M \longrightarrow M$ with

 $G(D') \subseteq G(D)$.

As an example the authors investigated the amount R of all graphs with a strong coupling in the pion-nucleon part. In every intersection of this graph only three lines do combine: 2 or 0 baryon lines, and 1 or 3 meson lines. It is shown that any graph of the sub-part R** can be majorized by one of the two diagrams shown in Fig. 2. R** is that sub-part of R where a nucleon polygon and pion lines appear in its graphs, and where the external points a and b are characteristic points. N. N. Bogolyubov is thanked for a valuable discussion. There are 2 figures and 5 references: 1 Soviet, 3 US, and 1 Italian.

Steady-state heat distribution in a cylindrical-symmetric unit cell of the active zone of heterogeneous reactors in the

case of convective heat transfer

PERIODICAL: Energia es Atomtechnika, no. 1, 1962, 41 - 46

TEXT: Part II. Determination of A_n coefficients. In Part I it was found that the solution of differential equation T(r,z) was given by the sum of Laplace's equation (in the form of an infinite series) and of Poisson's equation (in closed form): $T(r,z) = T_0(r,z) + T_1(r,z)$ (51). In the solution of this differential equation the unknown coefficients $A_n(n=0,1,2,3...)$ arise. A practicable way of calculating these coefficients is the application of equation systems with an infinite number of unknowns. (Reference is made here and in the following to L. V. Kantorovich and V. I. Krylov: Approximate methods of higher analysis (Hungarian edition, Budapest, 1955)). By this method the following two

Steady-state heat distribution ...

H/008/62/000/001/002/002 B122/B102

equations are found to yield the system of equations with an infinite number of unknowns for the determination of the \mathbb{A}_n :

$$A_0 = B_0 - \sum_{n=1}^{\infty} A_n \frac{r_n}{1B_n} \left[1 - (-1)^n\right] (n = 1,2,3,...)$$
 (73) and

$$A_{k} = \frac{B_{k}}{p_{k}} - \frac{1}{p_{k}} \sum_{n=1}^{\infty} A_{n} \frac{2r_{n}\beta_{n}}{1(\beta_{n}^{2} - \beta_{k}^{2})} \left[1 - (-1)^{n+k}\right]$$
 (74) (n = 1,2,...(k-1),(k+1),...)

Coefficients B_o and B_k are computable Fourier coefficients of f(z). By substitution of $A_k p_k = X_k$ into equation (74), this equation is transformed to a system of entirely regular equations having (according to a thesis of Kantorovich-Krylov) but one solution which can be determined by the method of successive approximations. $B_k = O(1/k^2)$; from a thesis of the above Soviet authors it follows that $X_k = O(1/k^2)$, for the unique solution of the entirely regular equation system tends toward zero with Card 2/4

X

32721 H/008/62/000/001/002/002 B122/B102

Steady-state heat distribution ...

 $k \rightarrow \infty$. In zeroth approximation $A_k^{(0)} = 0$, in first $A_k^{(1)} = B_k/p_k$. Coefficients $\boldsymbol{\Lambda}_{\mathbf{k}}$ and $\boldsymbol{B}_{\mathbf{k}}$ have been computed with data given in Part I and are plotted as functions of k. In the following the differential equation of heat transfer for an infinitely long fuel element $(\partial T^2/\partial z^2)$ is solved. Against the correct solution of the differential equation of temperature distribution in the fuel element T(r,z) and of the longitudinal temperature distribution t(z) in the coolant developed in Part I, axial heat transfer (in direction z) is neglected here. For this case, $\partial^2 T^4/\partial z^2 = 0$. This neglection considered, the corresponding approximate solutions T*(r,z) and t*(z) are obtained. Correct and approximate solutions are compared in the following. From graphs for the temperature distribution in three given cross sections of the fuel element and those for the longitudinal temperature distribution in the coolant, it is evident that differences between results of accurate and approximate calculations amount to a few % for the former, and only some hundredths of % for the latter. The error resulting from the neglect it axial heat transfer increases with the cross section of the fuel element Card 3/4

32721 H/008/62/000/001/002/002 B122/B102

Steady-state heat distribution ...

and with its thermal conductivity, and decreases with its length. If the slenderness ratio of the fuel element $2\text{Ro}/1 \ge 0.05$, and the thermal conductivity of its material $\lambda \ge 10$ kcal/m, the more elaborate method is commendable, especially if the heat-flux density on the mantle is here. Differential equations have been solved for bare fuel elements only. There are 9 figures and 13 references: 12 Soviet-bloc and 1 nor Soviet-bloc.

Examination of Heat Transfer of Suspensions

Energia ès atomtechnika, 1960, No. 9, pp. 388-395

TEXT: Some organic compounds or their mixtures (diphyl, diphenyl, terphenyl, etc.) exhibit properties that qualify them for use as reactor coolants. Their heat transfer capacity, however, is considerably lower than that of the conventional coolant, water. To improve the heat-transfer coefficient of these liquids, the authors suspended in them solids of high heat-transfer capacity and attained an improvement of 70% by an addition of 50 per cent by weight. The heat-transfer coefficient was calculated from Nusselt's empirical function. Heat transfer, however, also depends on viscosity. Since the viscosity of the suspension increases with respect to that of the pure liquid, the effect of the higher heat-transfer coefficient is balanced, and above a certain concentration the heat transfer of the suspension even decreases. In the graphite-diphyl test suspension this heat transfer maximum appeared at 90°C and with a graphite addition

card 1/2

Examination of Heat Transfer of Suspensions

H/008/60/000/009/002/002 B009/B057

of about 25 wt%. The relative viscosity versus concentration is plotted in Fig. 2 according to both Hatschek's and Orr's and Dalla Valle's formulas (Refs. 6 and 11, respectively). The experimental setup was essentially a single-tube heat exchanger. American researchers made similar experiments on graphite and aluminum suspensions (Ref. 11). For the evaluation of the test results, constants suggested by Bayer-Leverkusen, for the same mixture of diphenyl-exide and diphenyl were substituted in the formula of the heat-transfer coefficient. The use of suspensions as reactor coolants is associated with the following disadvantages: higher power consumption of the circulating pump, higher wear and tear of pumps, metal parts, etc. The use of suspensions as reactor coolants would not be advisable even if the heat transfer could be multiplied thereby. There are 10 figures, 2 tables, and 14 references: 3 Scviet, 2 US, 1 German, 1 French, and 3 Hungarian.

AUTHOR:

Németh, Géza, Raszl, Károly, Szabados László, Szeghő, Laszló and Torok, Antal

TITLE:

Stable temperature distribution (in case of convective heat transfer) in a cylinderical fuel

cell of the active zone of a heterogeneous nuclear reactor

PERIODICAL:

Referativnyy zhurnal, otdel'nyy vypusk. 42. Silovyye ustanovki, no. 7, 1962, 4, abstract 42.7.13. "Magyar tud. akad. Közp. fiz. kutatö int. kózl.", v. 9, no. 1-2, 1961, 3-23, III, IX

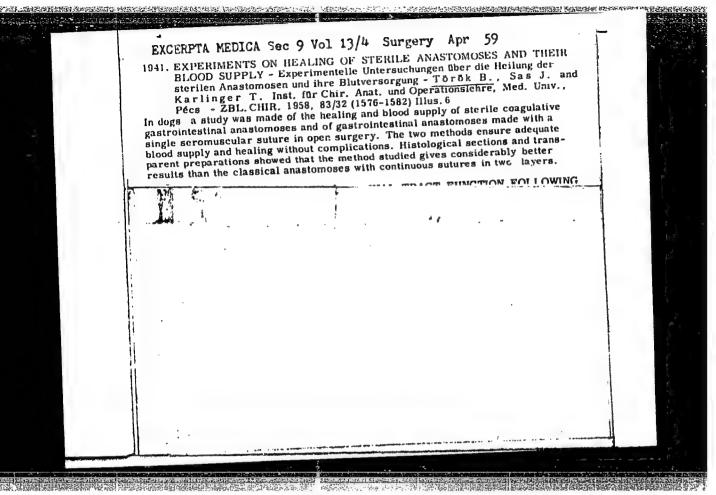

[Abstracter's note: Original language Hungarian].

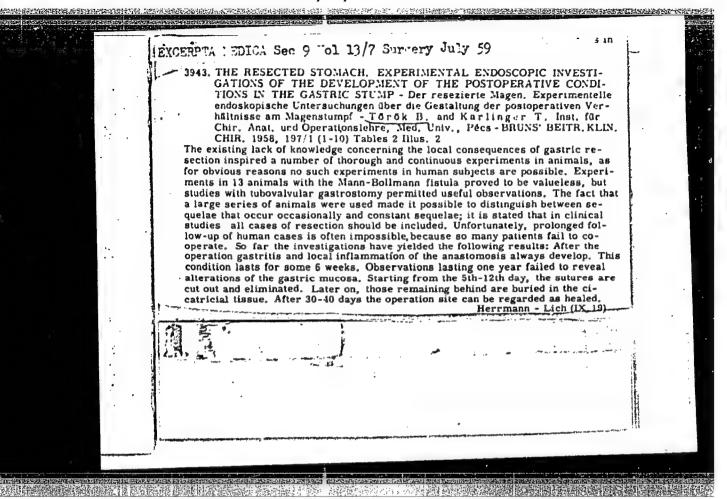

TEXT: A solution is presented of the differential equation for convective heat transfer in finite and infinite fuel elements. For exact solutions the coolant temperature can not be reproduced without knowing the temperature distribution in each fuel element. For the solution of the given equation the temperature distribution along the fuel element is assumed to be unknown. A comparison is given between exact and approximate solutions. There are 9 figures and 13 references.

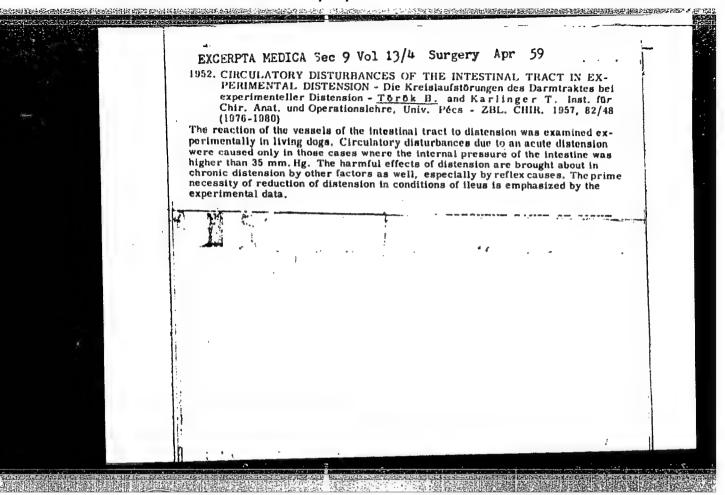

[Abstracter's note: Complete translation.]

"Measurement of the Fibrillational Threshold by Means of a Simple Electronic Installation."

Budapest, Kiserletes Orvostudomany, Vol XIX, No 1, Jan 67, pages 71-73.

Abstract: [Authors' Hungarian summary] A method and instrument was developed by the authors for measurement of the fibrillational threshold. The supplementary electronic unit is attached to the grid of the final stage of a cardotester channel and the R wave appearing there serves as the eliciting stimulus. This in turn is used as the starting stimulus of a conventional stimulator. The fibrillational threshold can be measured with ease by means of this method. All 5 references are Western. [Manuscript received 28 Feb 66.]

"Evaluation of a Modified Coronary Obstruction Method From the Viewpoint of Experimental Cardiac-Revascularization Operations."

Budapest, Kiserletes Orvostudomany, Vol XIX, No 1, Jan 67, pages 74-78.

Abstract: [Authors' Hungarian summary] The mortality data involving acute coronary obstruction, produced with the unopened thorax method on dogs, are examined by the authors. The mortality obtained (33 per cent) is considerably lower than that in the case of acute descendent ligature in the opened thorax (52-60 per cent). Attention is called to the importance of the descendent ligature testing method from the viewpoint of evaluation of cardiac revascularization operations. 4 Eastern European, 10 Western references. "ECG, PCG and Electromanometric Studies in Experimental Mitral Insufficiency"

Budapest, Kiserletes Orvostudomany, Vol 18, No 6, 1966; pp 663-668.

Abstract: On the basis of animal experiments the ECG changes developing in acute mitral insufficiency are described. On the basis of phonocardiographic and electromanometric data three groups may be distinguished: mild. moderately severe and severe. The data obtained in medium severe and severe syndromes are characteristic, and occasionally the changes may be expressed also by means of formulas. 29 references, mainly Western. "Faychogen Ventricular Fibriliation."

Budapest, Orvosi Hetilap, Vol 103, No 50, 16 Dec 62, pages 2361-2365.

Abstract: [Authors' summary] The authors describe a young woman with repeated attacks, since childhood, of loss of consciousness and paroxystic ventricular fibrillation. Hypokalexia is given as causative factor and the stracks were precipitated by hyperventilation due to excitement or emotional stress. This is the first description in the literature of ventricular fibrillation of a heart without demonstratie defect, precipitated by emotional factors.
